USER GUIDE / 01

Framecraft Ad Studio

User manual | 4 November 2026

Your images.
Your clips.
Your next app ad.

Create promotional videos in your browser using reusable layouts, animation controls, captions and audio. No separate video-editing application is required to use the editor.

Start here	What to know
Online studio	Open Framecraft Ad Studio
Local version	Open index.html from the complete dist folder in recent Chrome or Edge.
Your projects	Save in this browser, or download a project backup to move between computers.
This guide	Covers the current editor, including Custom video size.

Important: Framecraft arranges supplied media. It does not generate new faces, outfits, poses or human motion. Use finished images or clips you are permitted to use.

USER GUIDE / 02

Your first video

Follow the numbered steps. Open a step to revisit it; use Back and Next step to move through the settings.

Step	Action
01 / Choose a template	Select a layout that matches your reference.
02 / Video setup	Name the project; choose dimensions, duration and image fit.
03 / Add your images	Add finished results, original photos or video clips.
04 / Edit the main text	Set headings, alignment, fonts, borders and timed captions.
05 / Edit the watermark	Set its text, appearance and position independently.
06 / Choose animations	Select relevant motion, upload/loading or frame controls.
07 / Branding & end card	Add a logo or finished end card, then customize end-card effects and SFX.
08 / Audio & sound effects	Add background audio and timed sound effects.
09 / Review & export	Watch the complete preview, save a backup and export.

First test: make a short ad with a few assets before preparing a large batch. Check the downloaded file, not just the live preview.

USER GUIDE / 03

Choose the right template

Use the structure of your reference video to select the starting layout.

Template	Best use
Couple collage	Multiple result images in a grid, followed by one- or two-photo upload/loading and an end card.
Before to after	A source photo with a sliding result reveal.
One photo, many styles	An original photo followed by a sequence of finished style images.
Three-step demo	Upload, choose a style and reveal the result.
Result showcase	Single result images presented prominently, followed by an end card.
Framed Couple Video	Supplied video clips with a bordered frame, circular input portraits and an end card.

What a template does not do

It does not turn an original photo into a finished AI result. For example, a reference with kissing motion requires a supplied generated or filmed clip; still photos alone will not produce that action.

Results and original photos are different

Add result images holds your finished outputs. Original / before photo is the input image shown in a demonstration. Partner / second person photo is a second input when needed.

There is not yet a dedicated Single Photo Portrait template with a numeric percentage loader. The current loading library has decorative effects, including a liquid ring; it is not a numbered progress counter.

USER GUIDE / 04

Size, duration and assets

Prepare assets for the intended placement before building the ad.

Video size	Dimensions
Portrait	1080 x 1920
Square	1080 x 1080
Landscape	1920 x 1080
Custom	Enter your own width and height in Step 2.

Custom dimensions

Use even whole-number values from 256 to 3840 pixels per side, with a maximum canvas of 8.29 megapixels. Example: 1080 x 1350. Choose Auto or a standard content layout. The layout fits proportionally without stretching; remaining space uses the background color.

Images

You can add up to 12 JPG, PNG or WebP result images, including a set of only three. Drag result cards to reorder them. Choose Fill frame to fill each image area, or Show full image to preserve the complete picture with possible extra space.

Duration

Image-based templates offer 8, 12, 15, 20, 25, 30, 45 and 60 seconds. Their internal scene proportions are largely fixed. Framed Couple Video calculates its total from the individual scene lengths plus its end-card duration.

Asset preparation

Use sharp, correctly oriented files. Where a reference contains a double-exposure portrait or complex composite, supply that finished composition. The editor does not build those AI compositions from a single input photo.

USER GUIDE / 05

Text, captions and watermark

Main text, the upload-scene heading, captions and the watermark have separate controls.

1. Main text - Step 4

Enter the opening hook, supporting instruction, app name and call to action. Choose template default, left, center or right alignment. Alignment works within each text area, rather than moving the entire text block anywhere on the canvas.

2. Fonts and borders

Choose a provided font, color and border thickness. Fonts use local fallbacks when unavailable. Enable Use selected color for main text to override template text colors. An empty app name hides the showcase title badge.

3. Timed captions - Step 4

Click Add caption and enter text, start and end times in seconds. You can import an SRT file; importing replaces the current caption list. Choose caption color, background, size and top/middle/bottom position. Captions use the main text font and are burned into the output.

4. Watermark - Step 5

Choose its own text, font, color, size, position, opacity and border. Main text changes do not alter it. Turn it off if the supplied artwork already contains the required disclosure.

5. Upload heading - Step 6

The Upload heading style panel has its own font, size, color, alignment, vertical position, background box and text border. Preview heading pauses on the upload scene for adjustment.

Automatic speech transcription is not included. Enter captions manually or import an existing SRT. Use valid start/end times and keep text short enough to read.

USER GUIDE / 06

Motion, upload and loading

Step 6 shows controls relevant to the selected template, with a Preview this template button at the top.

Motion & transitions

Available for all templates. Start with Smooth, Energetic or Minimal movement, then optionally choose an extra visual effect. Effect intensity, speed and color appear when needed. A mixed preset is available, but a single subtle effect is easier to control.

Photo upload & loading

Available for Couple collage. Enable the upload scene. Select One photo for a centered original image, Two photos for original and partner inputs, or Auto to detect the available photos. A second plus slot is intentional when Two photos is selected without a partner image.

Loading controls	Choices
Animation	Fluid merge, orbiting dots, liquid ring, bouncing bubbles, morphing blob, photo scan or sparkle reveal
Appearance	Speed and size
Color	Solid color or a two-color gradient
Gradient direction	Left-right, top-bottom, diagonal or center-edge
Preview	Preview selected loading effect or Preview upload animation

Frame layout

Available for Framed Couple Video. Adjust border color and width, tilt, shadow, gradient background and connector symbol. These controls style the supplied footage; they do not generate motion within it.

Choose the template first. Upload/loading is not automatically part of Result showcase. Hidden controls keep their saved settings; hiding them does not delete your work.

USER GUIDE / 07

Video clips and trimming

Use Framed Couple Video when the subject moves in the reference, rather than relying on still-image animation.

1. Add result clips in Step 3

Upload up to six browser-decodable clips, up to 150 MB each. H.264 MP4 is a practical starting format. Unsupported codecs can fail to open even when the filename ends in .mp4.

2. Set up each scene

Choose its heading and two circular portrait images. If scene portraits are omitted, global original/partner images can be used. Reorder scenes with the arrow buttons.

3. Open Trim clip

Scrub the source preview. Use Mark start here and Mark end here, or enter precise In/Out times. Click Play selected range to review, then Use selected range.

4. Check the total duration

A trim updates the scene offset, scene length and total timeline. Each range must remain within the source and be between 0.10 and 60 seconds. Three 7-second scenes plus a 4-second end card make 25 seconds.

5. Preview full screen

Use the full-screen button beside the main Restart control, or Full-screen video in the trim editor. Press Esc to exit. Main full-screen preview has playback controls.

Trimming is non-destructive: the source file stays unchanged. This feature selects the portion used in the ad; it does not save a separate cut video file. Original clip audio is muted - add music and SFX in Step 8.

USER GUIDE / 08

Branding and end cards

Step 7 combines your ending artwork with independently controlled animations, particles and sound.

Choose the card contents

Use the generated logo/app-name/button layout, upload a finished end-card image, or upload an end-card video. Video takes priority over an image. For images, Show full image preserves the artwork; Fill frame may crop it. Match the output aspect ratio when possible.

Customization	Options
Card entrance	None, fade, zoom, slide or reveal wipe; adjustable entrance duration
Generated logo	Still, pulse, bounce, spin or fade
Generated button	Template default, pulse, bounce, slide or still
Particles	Off, sparkles, hearts, confetti, bubbles or stars
Particle settings	Color, amount, size, speed and opacity
End-card SFX	File, volume, delay after card starts, source trim and length

Preview with sound

Use Preview end card with sound. This starts at the end-card boundary and includes the normal audio mix. The dedicated end-card sound is anchored to that boundary, so it moves when earlier framed scenes change length.

Logo/button controls cannot animate text or icons already baked into an uploaded image or video. Whole-card entrance effects and particles can overlay it. Use a supplied end-card video for complex pre-rendered 3D animation. A short ending clip holds its last frame.

USER GUIDE / 09

Background audio and SFX

Step 8 lets you compose a soundtrack separately from the result footage.

1. Add music or voiceover

Choose a local audio file. Set volume, the source trim-start time and optional looping. This background track begins at the start of the ad.

2. Add animation sounds

Upload up to 12 SFX files, under 30 MB each. Each has a start time in the video, source trim, length and volume. Length 0 uses the available full sound, limited by the remaining video time.

3. Set timing

Upload, Loading and Reveal presets correspond to the Couple collage upload sequence. For other templates, enter times manually. The dedicated end-card sound in Step 7 follows the end-card boundary automatically.

4. Listen and adjust

Use the main Play button to hear the mix from the current timeline position. Restart playback after changing audio settings. Scrubbing stops the current audio preview. Balance SFX against music and voiceover to avoid overpowering them.

5. Reattach after reopening

Project backups preserve cue metadata and timing, not audio bytes. Reattach background audio, individual SFX and end-card SFX after opening the project elsewhere. A missing saved SFX produces a reattachment message.

Use music and sounds you are permitted to include in advertisements. The editor does not provide a licensed sound library, automatic beat matching, waveform editing or automatic transcription.

USER GUIDE / 10

Review and export

A clean preview is useful, but the downloaded video is the final quality check.

Check	What to inspect
Picture	Correct result order, source clips, face cropping and image fit
Text	Spelling, contrast, borders, caption timing and readability
Ending	App name, logo, CTA, particles and end-card duration
Audio	Music/SFX balance, source trim, synchronization and unwanted silence
Output	Correct dimensions, duration, actual file type and complete playback

1. Save a project backup

In Step 9, download a backup before export. Keep named versions for each variation you want to preserve.

2. Choose the available format

MP4 is offered when the browser supports recording it. Otherwise use WebM. Renaming a WebM file to .mp4 does not convert it. Browser support and machine performance affect the result.

3. Export in real time

Keep the tab visible and let the full duration finish. Avoid backgrounding the tab or starting another export. The download link remains below the preview.

4. Play the downloaded file

Confirm dimensions and duration, listen to the complete mix, and check the first frame, transitions and last frame. Try a short export first on a new computer or browser.

Implementation and simulated rendering/timing checks passed. The complete live video/audio export workflow has not yet been fully verified with real assets. Perform this test before daily production.

USER GUIDE / 11

Save, move and share projects

Project files and media files have different portability rules.

Action	Behavior
Save project	Stores one project in this browser. It does not automatically sync to another browser, computer or account.
Project backup	Downloads a .framecraft.json file with settings and embedded images.
Open project	Restores that backup. Reattach video/audio files.
Local to online	Download a backup locally; open it in the online editor; reattach clips and sound.
Share the local editor	Send the whole dist folder, including every .js file and style.css. Keep its files together.

Keep your source media

Retain original photos, result images, clips, music, SFX and end-card media in a project folder. Video/audio bytes are not embedded in backups. Renaming or deleting source files can make later reattachment harder.

Local and online

The online address loads the editor; it is not a shared cloud project library. The owner controls site sharing separately. Local file editing still works without publishing. Offline external fonts can fall back to system fonts.

Creating daily variations

Open a master backup, change the assets or wording, preview, and save a new named backup. Create a variation rotates result-image order and changes the hook; it does not generate new imagery or automatically export a batch.

USER GUIDE / 12

Troubleshooting and next checks

Use these checks before rebuilding a project or re-uploading every asset.

Problem	Try this
Changes do not appear	Refresh with Ctrl + F5. Locally, confirm you opened the newest complete dist folder.
A second plus slot appears	Step 6: choose One photo or Auto. Two-photo mode expects a partner input.
No loading scene in the preview	The upload sequence belongs to Couple collage. Select the correct template and enable its upload scene.
Title looks clipped	Use the latest files. The app-name badge sizes to its text; main headings have separate font/alignment controls.
Trim or clip will not play	Reattach the source; try a browser-decodable H.264 MP4 and a valid In/Out range.
No sound	Check volume, reattach files, confirm cue times fall inside the ad, then restart Play.
Caption is missing	Enable captions and check that end time is later than start time and includes the current preview time.
An effect does not animate the logo	Uploaded artwork has baked-in elements. Use generated card contents or supply a finished animated clip.
Export fails	Try a shorter video or smaller canvas, keep the tab visible, and try another supported format.

Production check: verify one complete export with real images/clips, captions, music, SFX and an end card in every output size you intend to use. The editor is still being refined; report browser version, template, settings and reproduction steps for any problem.
